TxtAn is a simple text file analyzer using a recursive method, provided as a command line tool. It is conceived as a means for easy and fast analysis of large text files, much faster than traditional methods such as `grep` or `awk`. Unlike these, this tool works recursively, enabling you to analyze a large number of files in a single call, with minimum user input. For example, when analyzing a text file measuring 1 GB in size, you would only need to input once the path where you want to save the results. The tool can analyze thousands of files in the same folder and produce an output file of summary statistics, such as the number of blank lines, written lines, and the overall text, with the ability to select which character set or encoding you would like to use. If you are satisfied with the results, you could use the tool to extract, replace, or remove lines that fit certain criteria. For example, you could retrieve lines containing a certain set of words, and then proceed to modify them, as you see fit.

AMOS AND THE STORY BEHIND TxtAn ----- The tool came from a need of a powerful means of analyzing the content of a text file. Most of the solutions, both free and paid, on the Internet simply display some relevant information about the current file. There is no more information about the file than that, and this is the very strangest part about these methods. Think for example of the file.config/metacity/window-buttons-unity.xml, as shown below: What are the files that contain this text, and what information does it contain? For that reason, I built TxtAn, a tool that will interpret the content of a text file and display as much information as possible once you enter the command line. For example, the command line `.\TxtAn64.exe C:\Users\My_`
