### What's New In Keep Alive?

How it works? It's important to keep a web application alive for various reasons: It makes a web application more useful by allowing requests to be sent to the web application even when it's not running. If you try to browse a web page when it's offline, for instance, you don't get anything back. It allows web applications to "phone home", so that you can keep track of their status and configuration. It allows the owners of a web application to get feedback on how their site is performing. But, keep-alive applications tend to rely on servers sending a 'heartbeat' request to a client once in a while. If a server fails, the client can contact the server via a "ping" request but the server might not respond. The client will often be able to tell that the server is offline but it's not easy or quick to tell if it's a server application or a client application which is offline. With this application, you'll be able to see every details about your server application, even when the server's offline! Keep-Alive 2 runs on Windows 2000 and above and supports iSCSI, SMB2, SMB3, and block devices.
